

Quick & simple from manual test to automation with the test fixture ATS MA12 of INGUN and KT1000i of KABTEC

Your INGUN basic unit MA-2112
for manual testing of your PCBs

Your INGUN test fixture ATS MA 12

Your KT1000i
for automated testing of your PCBs

What's unique.

You can use the test fixture set ATS MA 12, provided that the specifications for the test fixture removal of the KT1000i are taken into account, both in the manual testing with the INGUN basic unit MA-2112 and in your automated testing facility with the KT1000i. The test fixture change can be handled efficiently and quickly (in less than 1 minute) and offers maximum flexibility in your testing environment.

Additional advantage.

You save money because you can easily take test fixture kits with you when you switch from manual testing to automated testing for new product start-ups or when your requirements increase dramatically. Similarly, you can return a product from the automated testing to the manual testing or switch to the manual testing depending on your requirements for product run-outs or heavily fluctuating quantities.

KABTEC supports you.

If you decide in favour of the KT1000i, we will gladly support you with the test fixture removal and provide you with corresponding construction documentation.
